

Turn Jira issues into actionable investigations.

AI-powered ticket triage, log analysis, and approved repository discovery.

Too much time spent finding where to start.

Software engineering teams face four major friction points during initial incident triage.

Incomplete Jira Tickets

Incidents filed with missing server logs, uncle

Scattered Telemetry

Engineers must dig through multiple log agg

Manual Error Extraction

Parsing distributed stack traces, HTTP 503 ps

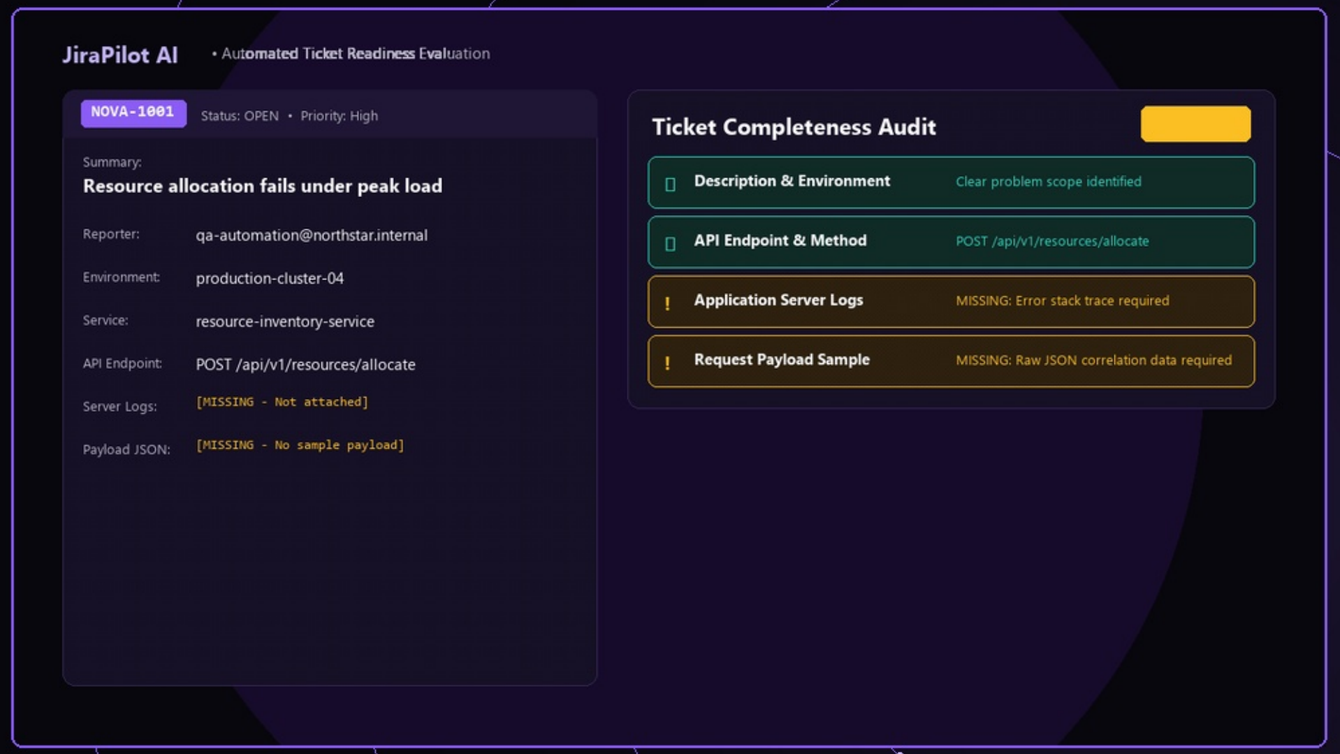

Locating The Right Repository

Large microservice architectures make findi

The challenge isn't only solving the issue. It's organizing the investigation.

Every new issue gets a clearer next step.

Automated completeness audit highlights missing fields and prepares reporter clarification comments.

How Readiness Validation Works:

1. Real-Time Jira Webhook
Incoming issues in project NOVA ingested immediately.

2. Multi-Field Diagnostic Check
Validates description, API endpoints, logs, and payloads.

3. Clear Amber Highlighting
Missing data flagged visually to avoid premature investigation.

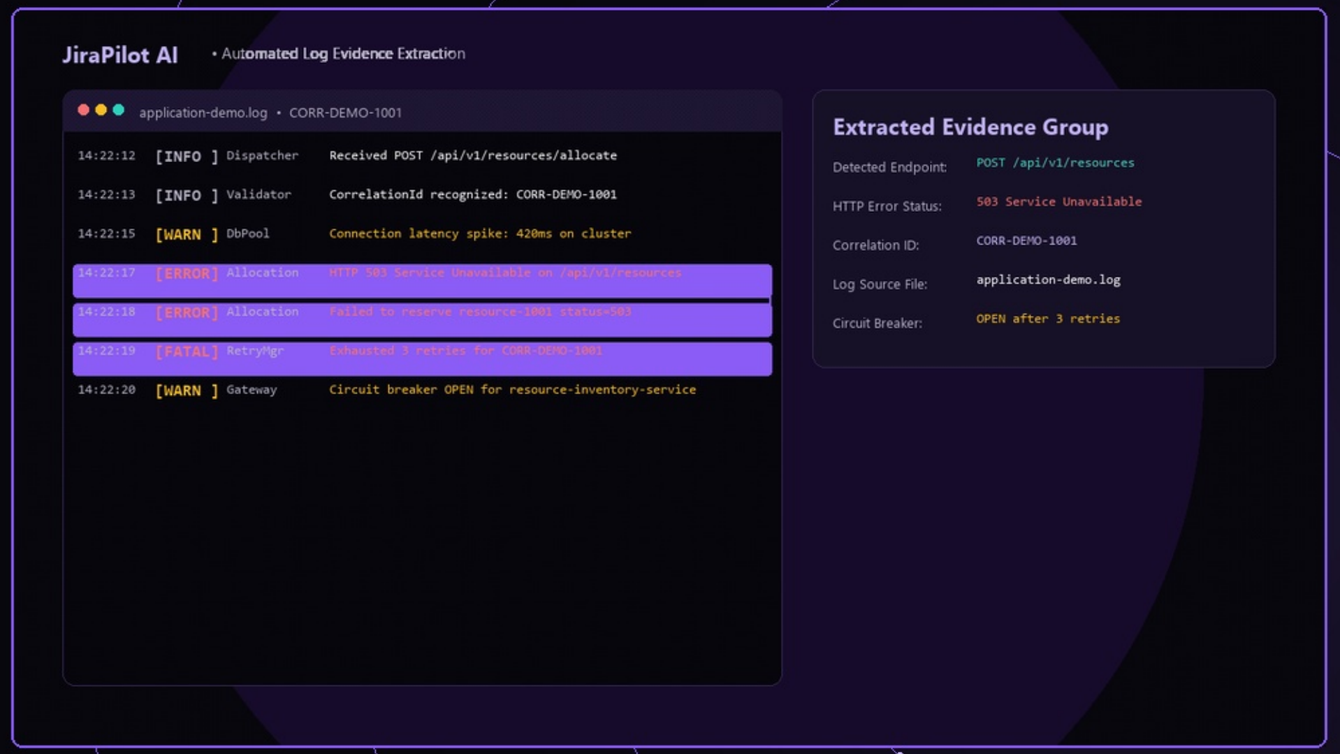

4. Automated Reporter Comment
Polite prompt generated with exact requirements.

5. Honest Status Transitions
Issue moves to WAITING_FOR_INFO until evidence is provided.

Identify missing information before investigation goes deeper.

Turn raw logs into structured evidence.

Extracts endpoints, status codes, and correlation traces while maintaining clear hypothesis boundaries.

Synthetic Demo Evidence:

Log Source:
application-demo.log (Northstar synthetic telemetry)

Failing Endpoint:
POST /api/v1/resources/allocate

HTTP Failure Status:
503 Service Unavailable

Correlation ID:
CORR-DEMO-1001 (Tracked across 3 retry attempts)

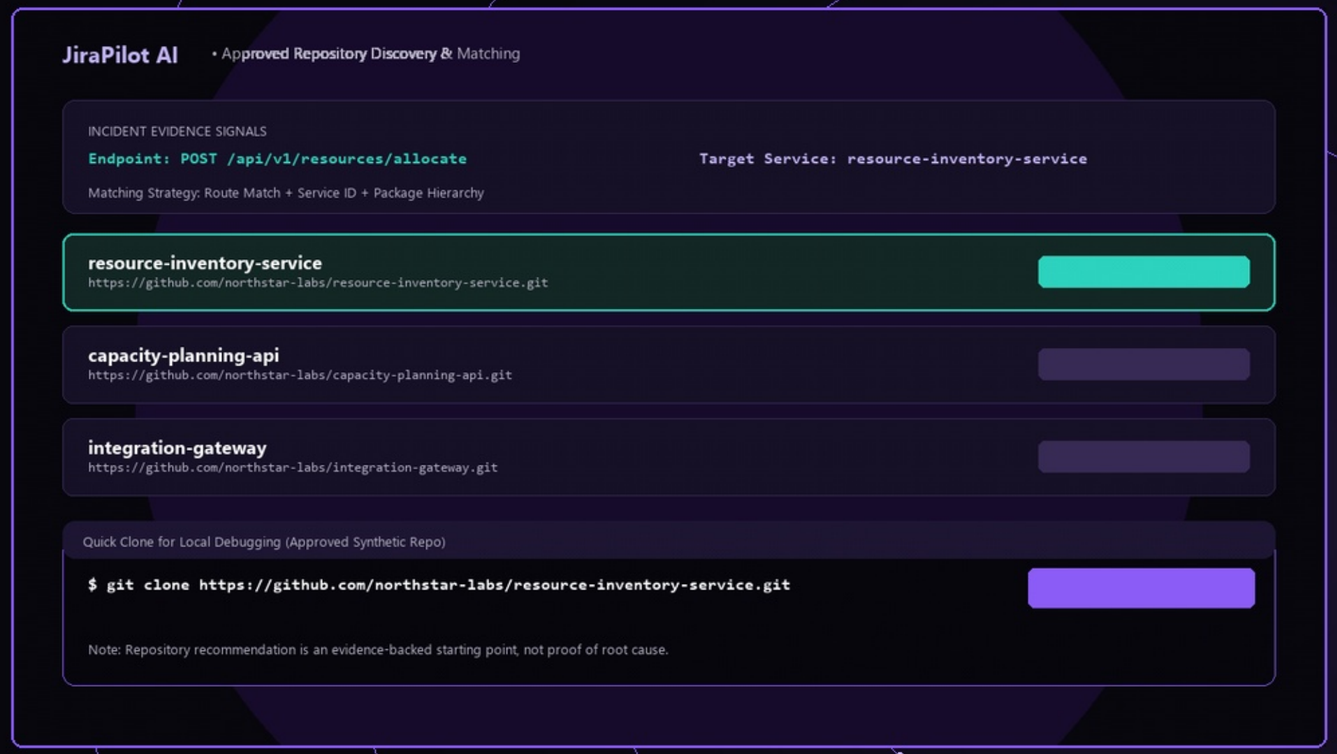

Circuit Breaker State:
Tripped to OPEN due to database pool exhaustion

Probable Cause:
Evidence-backed hypothesis requiring engineer verification

From raw log lines to a clearer debugging path.

Find a relevant place to start debugging.

Multi-signal catalog lookup maps endpoints to verified synthetic repositories with zero invented URLs.

Configured Catalog Match:

Approved Repository:
resource-inventory-service

Clone Command:
`git clone https://github.com/northstar-labs/resource-inventory-service.git`

Matching Strategy:
Route Match (Weight 35) + Package Trace (Weight 25)

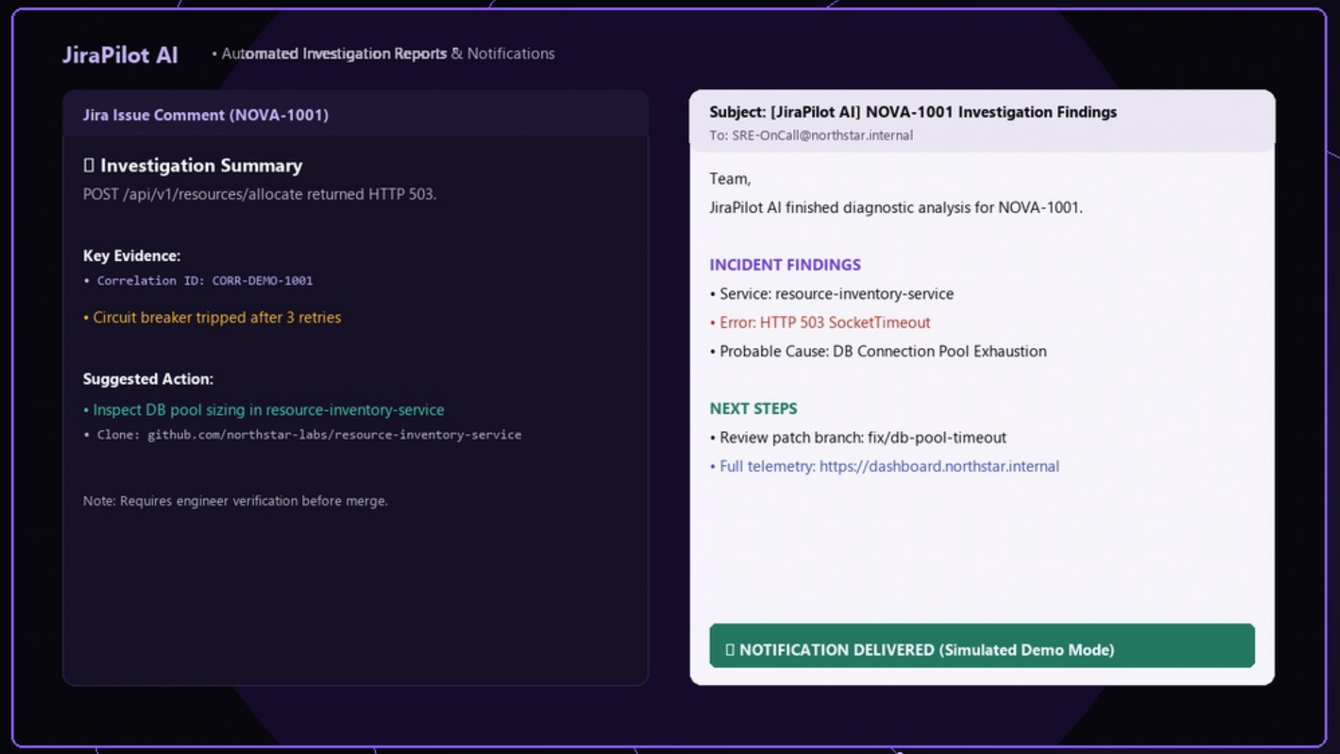

Developer Handoff:
One-click copyable clone command ready in terminal panel

Safety Guarantee:
Clearly distinguished as a suggestion, not proven root cause

Give developers a more direct starting point for investigation.

Clear findings. Better handoffs.

Structured investigation reports posted to Jira Cloud with concise stakeholder email notifications.

Consistent Report Format:

1. Issue Summary
Clear executive recap of customer impact

2. Evidence Observed
Endpoints, HTTP statuses, and correlation IDs

3. Probable Cause
Synthesized hypothesis with explicit confidence score

4. Recommended Next Steps
Actionable verification and reproduction steps

5. Approved Repository
Direct link to source code package and branch

6. Honest Integration
Delivery status marked as Simulated in demo mode

Prepare consistent investigation updates without repetitive manual writing.

One connected investigation workflow.

Modular multi-tier architecture connecting Atlassian Jira, Spring Boot, FastAPI, and React.

Unified Dashboard

□ Consistent Ticket Validation

Every Jira issue is checked for diagnostic completeness be

□ Better-Organized Evidence

Scattered logs are clustered by correlation ID and highligh

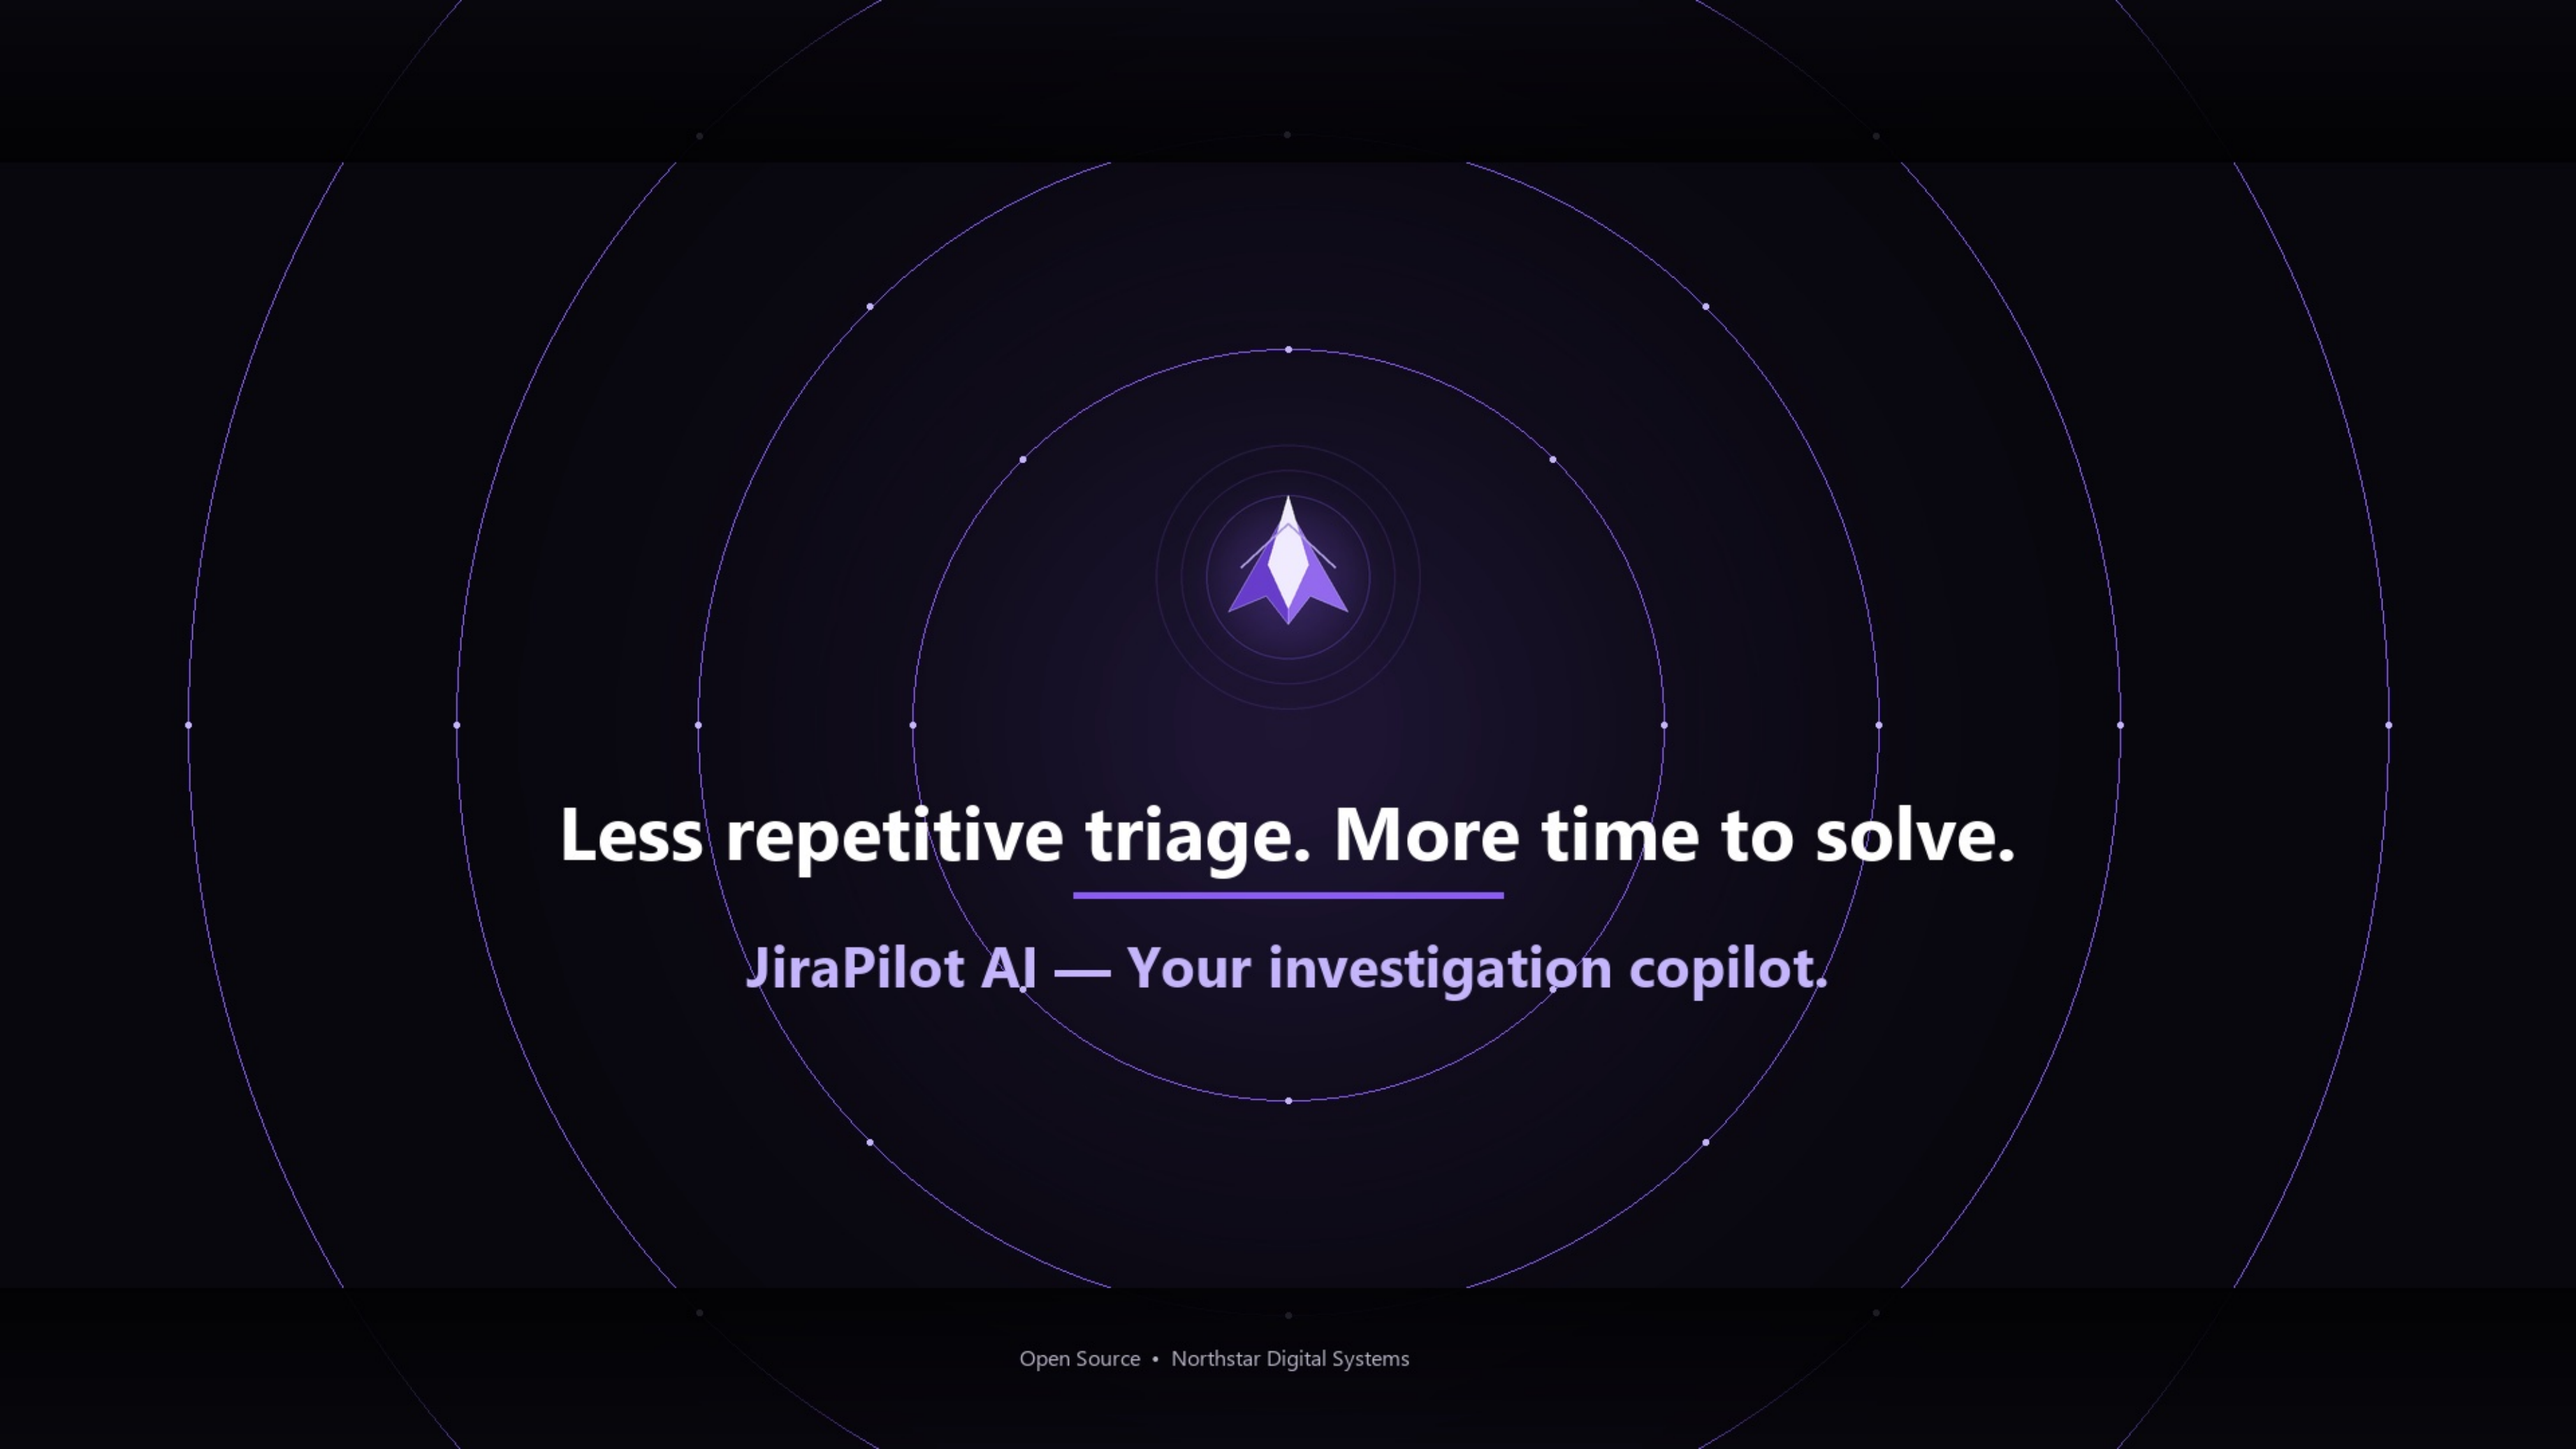

□ Faster Repository Discovery

Engineers get copy-ready clone commands for approved s

□ Clearer Reporting & Handoffs

Standardized markdown summaries ensure QA, developers, and on-call SRE

Designed to organize the investigation while keeping developers in control.

Less repetitive triage. More time to solve.
